## M213 STREAKERS

The M213 STREAKERS end mills are designed specifically for extreme tool paths often used in the high-performance machining of aluminum alloys. Our special end face and flute grinds create a free cutting action that allows for aggressive plunging and ramping moves.

- Plunge at high feed rates up to $1 \times$ diameter without using a peck cycle.
- Mill deep slots - even over $1 \times$ diameter deep - with great chip evacuation.
- Run steep ramp angles for high feed rates on entry moves.

The M213 STREAKERS end mill does all this AND leaves a superior surface finish.

High polish

Extremely large flute cavity

For high-performance machining in aluminum alloys.
> 37-degree helix
> High polish flute face
> Optimized wiper flat
> Improved corner strength
> Extremely large flute cavity
> Extremely fine cutting edge
> Uniquely designed end face and gashing

N

For high-performance machining in aluminum alloys.
, Extremely fine cutting edge
, Uniquely designed end face and gashing
> High polish flute face
> Extremely large flute cavity
> Optimized wiper flat

## TECHNICAL RESOURCES

## IMPROVED ENTRIES

The M213 STREAKERS series is designed to excel when using a variety of entry moves - helical ramping, plunging, and straight-line ramping. The M213 efficiently creates and evacuates the chips in all entry moves, allowing you to choose your tool path based on the part requirements and your programming needs.

## METHOD 1: Helical Entry

Helical ramping is a preferred entry method due to the lower impact and stress placed on the end mill, which increases tool life. Helical ramping also creates the entry pocket without increasing cycle time to the process and allows for milling to deeper $Z$ depths. The M213 can helical ramp to the depth of the tool's length of cut.

| Tool | Max Ramp Angle | SFM and Feed Rate | Max Ramp Depth | Max Hole Diameter |
| :---: | :---: | :---: | :---: | :---: |
| M213 | $15^{\circ}$ | Please reference data in chart on page 7. | Equal to LOC | (D x 2) - (corner radius $\times 2$ ) |

## METHOD 2: Plunging

A pre-drilled starter hole is no longer needed when milling with the M213 series. The end face geometry allows for a plunge move in the Z-axis up to $1 \times$ diameter at feed rates that compare to a drill. Plunging to depth and milling that level at high feed rates keeps the metal removal rates high and saves the time of a tool change.

| Tool | Max Ramp Angle | SFM | Feed | Max Ramp Depth | Max Peck Depth |
| :---: | :---: | :---: | :---: | :---: | :---: |
| M213 | $90^{\circ}$ | Use slotting speed | Use slotting IPT $\times .9$ | $1 \times \mathrm{D}$ | Up to $1 \times \mathrm{D}$ per peck |

## METHOD 3: Straight Line Ramping

The M213 end mill can straight-line ramp at an entry angle up to $45^{\circ}$ which saves time using the traditional zig-zag entry tool path. Caution: machine horsepower requirements increase as the ramp angle increases. Once reaching the final $Z$ depth, the $M 213$ can slot up to $1 \times D$ depth with no clogging.

| Tool | Max Ramp Angle | SFM and Feed Rate | Max Ramp Depth | Max Ramp Length |
| :---: | :---: | :---: | :---: | :---: |
| M213 | $45^{\circ}$ | Please reference data in chart on page 7. | $1 \times \mathrm{D}$ | $(1 \times \mathrm{D}) /$ drop per inch |

Use this guide as an aid in determining maximum ramp length.

| Ramp Angle | Drop (per inch) |
| :---: | :---: |
| $1^{\circ}$ | 0.0175 |
| $2^{\circ}$ | 0.035 |
| $2.5^{\circ}$ | 0.04375 |
| $3^{\circ}$ | 0.0525 |
| $3.5^{\circ}$ | 0.06125 |
| $5^{\circ}$ | 0.0875 |
| $10^{\circ}$ | 0.175 |

| Ramp Angle | Drop (per inch) |
| :---: | :---: |
| $15^{\circ}$ | 0.2625 |
| $20^{\circ}$ | 0.35 |
| $25^{\circ}$ | 0.4375 |
| $30^{\circ}$ | 0.525 |
| $35^{\circ}$ | 0.6125 |
| $40^{\circ}$ | 0.7 |
| $45^{\circ}$ | 0.7875 |

## TECHNICAL RESOURCES

## ADJUSTMENTS FOR BALL NOSE END MILLS

The speeds and feeds of ball nose end mills must be adjusted to ensure proper tool life. Adjustments are based on the amount of tool engagement.

## If the depth of cut (ADOC) is $<50 \%$ of the tool diameter:

Adjustments must be made to determine the effective cutting diameter and to adjust for axial chip thinning. Follow these steps:

STEP 1: Use speed and feed values for slot cuts from the speed and feed charts for the appropriate material and tool diameter.
Note: Make an additional adjustment using the chart to the right if the tool projection exceeds $2.5 \times$ the tool diameter.

| Projection | Speed Adi | Feed Adi |
| :---: | :---: | :---: |
| $>2.5$ to $3 \times D$ | SFM $\times .95$ | IPT $\times .95$ |
| $>3$ to $4 \times$ D | SFM $\times .90$ | IPT $\times .90$ |
| $>4$ to $5 \times$ D | SFM $\times .80$ | IPT $\times .80$ |
| $>5$ to $6 \times$ D | SFM $\times .70$ | IPT $\times .70$ |

STEP 2: Determine the effective cutting diameter (De) of the end mill based on the axial depth of cut. The effective cutting diameter will be used to make both speed and feed adjustments.

For easy reference, use the chart below.

| Depth of Cut (ADOC) | 1/8 |  | 1/4 |  | 3/8 |  | 1/2 |  | 3/4 |  | 1 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Depth | De | Depth | De | Depth | De | Depth | De | Depth | De | Depth | De |
| 10\% of tool diameter | . 013 | . 075 | . 025 | . 150 | . 038 | . 225 | . 050 | . 300 | . 075 | . 450 | . 100 | . 600 |
| 20\% of tool diameter | . 025 | . 100 | . 050 | . 200 | . 075 | . 300 | . 100 | . 400 | . 150 | . 600 | . 200 | . 800 |
| 30\% of tool diameter | . 038 | . 115 | . 075 | . 229 | . 113 | . 344 | . 150 | . 458 | . 225 | . 687 | . 300 | . 917 |
| 40\% of tool diameter | . 050 | . 123 | . 100 | . 245 | . 150 | . 367 | . 200 | . 490 | . 300 | . 73 | . 400 | . 980 |
| 50\% of tool diameter | . 063 | . 125 | . 125 | . 250 | . 186 | . 375 | . 250 | . 500 | . 375 | . 75 | . 500 | 1.00 |

STEP 3: Calculate speed based on using the effective cutting diameter. Use the standard to RPM conversion formula. Substitute the effective cutting diameter ( De ) for the actual tool diameter (D).

STEP 4: Calculate the adjusted feed rate based on the effective cutting diameter and the axial chip thinning formula.

$$
R P M=(S F M \times 3.82) / D e
$$

$\mathrm{D}=$ Actual tool diameter
IPT = Feed rate from chart for slot milling
De $=$ Effective cutting diameter
IPTadj = (D x IPT) / De

## The new feed rate is calculated:

IPM = RPM x (Z x IPTadj)

IPM = Inches per minute
Z = \# of flutes
IPT adj = Adjusted chip load per tooth fractional

## If the axial depth of cut (ADOC) is $\mathbf{5 0 \%}$ of the tool diameter:

- Use the speed and feed values shown for the slotting operation in the speed and feed charts for the series of end mill being used.
- If the tool projection exceeds $2.5 \times$ the tool diameter, adjust the slotting speeds and feeds by the chart for long reach tool adjustments.

## SURFACE FINISH

Radial depth of cut (RDOC), or step-over, is based on the desired finish. The lighter the step-over, the lower the scallop height (material left uncut by the radius of the tool), and the better the finish. These charts calculate approximate scallop height using the following formula:

$$
h=\text { Scallop height }
$$

$$
h \sim\left(a e^{2}\right) /(8 R)
$$

ae = Radial step-over
$R=$ Radius of end mill (tool diameter x .5)

| Tool <br> Diameter | Step-over <br> \% of OD | Step-over Actual | Approx Scallop Height |
| :---: | :---: | :---: | :---: |
| 1/8 | 10\% | . 013 | . 0003 |
|  | 20\% | . 025 | . 0013 |
|  | 30\% | . 038 | . 0028 |
| 1/4 | 10\% | . 025 | . 0006 |
|  | 20\% | . 050 | . 0025 |
|  | 30\% | . 075 | . 0056 |
| 3/8 | 10\% | . 038 | . 0009 |
|  | 20\% | . 075 | . 0038 |
|  | .30\% | . 113 | . 0084 |
| 1/2 | 10\% | . 050 | . 0013 |
|  | 20\% | . 100 | . 0050 |
|  | 30\% | . 150 | . 0113 |
| 3/4 | 10\% | . 075 | . 0019 |
|  | 20\% | . 150 | . 0075 |
|  | 30\% | . 225 | . 0169 |
| 1 | 10\% | . 100 | . 0025 |
|  | 20\% | . 200 | . 0100 |
|  | 30\% | . 300 | . 0225 |
